

Derek M. Reedy

derek.m.reedy@gmail.com | (908) 285-4320

Full-stack software engineer with a decade building production enterprise AI systems, emphasizing evaluations, testing, and infrastructure.

Work:	Writer	2023 to present
	Independent	Cambridge, MA
	• Wrote an 80,000-word first draft of a speculative science fiction novel. • Used Claude to develop a L^AT_EX-based typesetting and digital publishing pipeline with a git-backed revision system.	
	Lead Software Engineer	2021 to 2023
	IBM Conveyor AI	Cambridge, MA
• Designed, and led a five-developer team to implement, a low-code framework and service for building and running compound AI pipelines—a distributed orchestration platform for composing modular AI and business logic components into production-ready workflows with ready-made APIs. • Implemented demos of modern LLM applications and patterns in this framework, including agentic loops and retrieval-augmented generative QA, before the launch of ChatGPT. • Led the product through the IBM new product launch process, meeting enterprise security, code rigor, and quality requirements. • Engaged internal and external customers with bespoke demos and pilot projects, including a 2022 Digimarcon talk on custom AI pipelines for marketing.		
	Advisory Software Engineer	2015 to 2021
	IBM Watson Natural Language Classifier	Cambridge, MA
	• Designed and implemented CI/CD infrastructure for Kubernetes-based cloud services, coordinating the work of four internal component development teams through automation, and bringing the iteration time for releases down from a week to days. • Took over a natural language intent classification cloud service and led two further years of its development, project management, and release, managing new feature delivery, GDPR and HIPAA compliance, security, availability, and platform maturity. • Reduced time-to-delivery of new experimental algorithmic features from months to weeks by designing and implementing a load-testing and benchmarking framework. • Partnered with IBM Research teams in hardening and productizing AI systems.	
	Software Engineer	2013 to 2015
	IBM Watson	Littleton, MA
• Built out an evaluation harness covering components of a multi-stage, multi-language DeepQA question-answering pipeline, including natural language processing algorithms, information retrieval systems, and machine learning algorithms. • Collaborated with IBM Research and the original Jeopardy! Watson team to move features from research into product. • Developed a noisy-channel spellchecker service with an evaluation harness built on an automatically generated and updated corpus of paired spelling mistakes and corrections scraped from Wikipedia edits. • Developed tooling to visualize test history and failure patterns for individual components, shortening daily test review to minutes.		

Skills:	AI	LLM tool use and agentic loops, RAG, evaluation design, NLP/IR (Lucene/Solr, UIMA), Claude Code
	Languages	Java, Python, TypeScript (Node.js), Groovy, Elixir, LISP, Prolog, C++
	Platform	Kubernetes, AWS, Terraform, Docker, HashiCorp Vault
	Development	Cucumber, Git, Jenkins, PostgreSQL, Redis, Kafka, Pandas, D3

School:	B.S. Computer Science and Cognitive and Brain Science	2008 to 2012
	Tufts University	Medford, MA
Coursework emphasizing artificial intelligence, linguistics, machine learning, natural language processing, neuroscience, programming languages, and theory of mind.
